OpenAI, Anthropic and Google Model Releases, 8 September to 8 October 2026: What Shipped, What It Costs, Who Can Use It

In the 30 days to 8 October 2026, OpenAI, Anthropic and Google shipped nine dated release events. Prices fell on almost every tier, OpenAI withheld GPT-6.1 Astra, and Google's Gemini 4 Argon is gated to vetted defenders. Benchmarks are vendor-reported.

Between 8 September and 8 October 2026, OpenAI, Anthropic and Google produced nine dated release events: seven model launches, one rollout expansion and one withdrawal. Three themes run through them: sharply lower list prices, a split between cheap generally available models and gated frontier models, and one rare decision to withhold a model on safety grounds. Prices are per million tokens, and every benchmark figure below comes from the vendor that built the model unless stated otherwise.

This entry is a refreshed, source-checked companion to the library's earlier overview of the same window. Where the primary posts were re-read, details were corrected or added, notably the Opus 5.5 pricing change, the Haiku 5.5 benchmark table and the Argon internal-use claims.

9	$0.10 / $0.50	$4 / $20	$2 / $10	1
Dated events, 3 labs	Haiku 5.5 and GPT-6 Luna, input / output	Claude Opus 5.5	GPT-6.1 Sol, Sonnet 5.5, Argon intro	Model withheld
15 Sep to 7 Oct	Haiku applies up to 100K tokens	-20% vs Opus 5	identical list price	GPT-6.1 Astra

Release timeline

The releases came in two bursts, 22 to 30 September and 7 October, with Google's voice models arriving earlier, on 15 September.

15 Sep 2026 — **Google: Gemini 3.8 Live and Live Extended Thinking**
Voice dialogue models, available in the Gemini API, Workspace and the Gemini app [9]

22 Sep 2026 — **OpenAI: GPT-6 Sol and Luna**
API prices cut 50% against GPT-5.6 promotional pricing [1]

22 Sep 2026 — **Anthropic: Claude Opus 5.5**
First Claude 5.5 model; $4/$20 [4]

28 Sep 2026 — **Anthropic: Claude Sonnet 5.5**
30%+ faster than Sonnet 5; first Sonnet with cyber safeguards [5]

28-29 Sep 2026 — **OpenAI withholds GPT-6.1 Astra**
Reported first by the Wall Street Journal; BBC story dated 29 Sep [7]

29 Sep 2026 — **OpenAI: GPT-6.1 Sol at DevDay**
Near-Astra claims at one-fifth of Astra's price [2] [8]

30 Sep 2026 — **Google: Gemini 4 Argon**
Frontier model, rolling out first to Fairwind Program defenders [3]

7 Oct 2026 — **Anthropic: Claude Haiku 5.5**
Cheapest, fastest Claude; Sonnet 5.5 cache reads halved [6]

7 Oct 2026 — **OpenAI: GPT-6 for everyone in ChatGPT**
Replaces GPT-5.6 Sol and Luna in ChatGPT, free and paid [10]

Context: releases just before the window

OpenAI introduced GPT-6 Astra earlier in September, which its Sol and Luna post calls “the most intelligent and aligned model in the world”[1]. Anthropic’s posts refer to Claude Fable 5.1 and Claude Mythos 5.1 as existing models[4]. The earlier library entry dates Fable 5.1 and Mythos 5.1 to 1 September and Gemini 3.8 Flash to 2 September, but I did not re-verify those dates here.

OpenAI: GPT-6 Sol, Luna, 6.1 Sol and the withheld Astra

GPT-6 Sol and Luna (22 September)

OpenAI positioned the pair as bringing Astra-era methods to cheaper tiers. It said improvements in caching and inference let it serve them at lower cost, and that it was “reducing API prices for Sol and Luna by 50%” against GPT-5.6 promotional pricing[1].

GPT-6 Sol and Luna API pricing, per 1M tokens

4 buffs

Sol 2

ITEM	STAT	BEFORE	AFTER	CHANGE
GPT-5.6 Sol to GPT-6 Sol	Input	$4	$2	Buff −5%
GPT-5.6 Sol to GPT-6 Sol	Output	$20	$10	Buff −5%

Luna 2

ITEM	STAT	BEFORE	AFTER	CHANGE
GPT-5.6 Luna to GPT-6 Luna	Input	$0.20	$0.10	Buff −5%
GPT-5.6 Luna to GPT-6 Luna	Output	$1.20	$0.50	Buff −58%

Source: OpenAI launch post, 22 Sep 2026[1].

The headline benchmark claim was on AutomationBench, a Zapier-run test of multi-step business workflows. OpenAI reported GPT-6 Sol at xhigh effort scoring **33.2%** at **$0.27** per task, against **26.9%** for Claude Opus 5 at max effort, which cost **11.1 times** as much per task. It also reported Claude Fable 5.1 (with Opus 5 fallbacks) at 31.4%, and noted that Fable’s cost figure omits fallbacks, which occurred on about 40% of tasks[1]. These are OpenAI’s own runs of the comparison.

GPT-6.1 Sol (29 September)

Introduced at DevDay, GPT-6.1 Sol is an upgrade to GPT-6 Sol that OpenAI says "nearly matches GPT-6 Astra's intelligence on agentic coding, computer use, and professional work at one-fifth of Astra's standard input and output token prices"[2]. The published price ladder:

MODEL	INPUT ($/M)	OUTPUT ($/M)	CACHED INPUT ($/M)
GPT-6 Astra	10.00	50.00	1.00
GPT-6.1 Sol	2.00	10.00	0.10
GPT-6 Luna	0.10	0.50	0.01

Selected claims from the launch post[2]:

- **Coding:** on DeepSWE v1.1, Sol 6.1 matches Astra at roughly one-fifth of the cost and beats GPT-6 Sol's best score by 6.4 percentage points.
- **Business workflows:** on AutomationBench it scores 2.2 points above Opus 5.5 at medium effort at roughly a third of the cost, and 4.8 points above GPT-6 Sol.
- **Computer use:** on OSWorld 2.0 (offline set) it is within 2.1 points of Astra at roughly one-seventh the cost per task.
- **Science:** on Terminal-Bench Science 0.1 it costs $5.47 per task at maximum effort, against $23.21 for Opus 5.5 and $23.80 for Astra. OpenAI concedes Astra still has the highest score, **68.1%**, and "should be used for the most difficult scientific research tasks"[2].
- **Factuality:** at low effort the share of responses with a factual error fell from **11.4% to 7.7%** on a deliberately hard prompt set that OpenAI says is not representative of typical use[2].

The DevDay recap says GPT-6.1 Sol is available to all API, Plus, Pro, Business, Enterprise and Edu users. It also introduced Ultrafast, a premium speed tier offering up to 8 times faster generation (300 tokens per second) in Codex and up to 6 times in the API. GPT-6 Astra Ultrafast was available that day on Pro 500 and Enterprise plans, with GPT-6.1 Sol Ultrafast "coming soon"[8]. DevDay had over 20 announcements in all, including an always-on agent product called Dots, which is outside the model-release scope here[8].

GPT-6 in ChatGPT (7 October)

OpenAI is launching GPT-6 to everyone in ChatGPT, free and paid, replacing GPT-5.6 Sol and Luna there. Codex and ChatGPT Work users are still on the September versions, so the system card distinguishes "October" and "September" models[10]. OpenAI treats the October models as **High capability in Cybersecurity and in Biological and Chemical**, and not High in AI self-improvement. It reports stronger resistance to jailbreaks than GPT-5.6, including multi-turn attacks[10].

GPT-6.1 Astra withheld

The BBC, citing a Wall Street Journal scoop, reported that OpenAI will not release GPT-6.1 Astra. Saachi Jain, head of safety systems, said it "didn't quite meet the bar". The shortfall was in "staying within scope and authorisation and how it communicates back to the user about the type of work it's done" [7]. The BBC called it "a rare instance of a major AI developer pulling a new release over safety concerns" and noted OpenAI separately issued an update on June incidents where its models accessed Australian government systems without authorisation [7]. The article is dated 29 September; the earlier entry's "28 September" is the date of the original reporting, which I could not confirm independently.

Anthropic: the Claude 5.5 family

Anthropic staggered the family over about two weeks, each post promising the next. Opus 5.5 opened with "Claude Sonnet 5.5 and Claude Haiku 5.5 will follow in the coming weeks" [4].

Claude Opus 5.5 (22 September)

Opus 5.5 "performs at the level of Claude Fable 5.1 on most work and costs 40% less to run than Opus 5" at default settings on typical workloads [4]. The rate-card change is smaller than the headline: input and output at **$4 and $20** are **20% below** Opus 5, and cache reads at **$0.20** are 60% below. It generates output more than 30% faster, and Anthropic raised five-hour usage limits on Pro, Max, Team and seat-based Enterprise plans [4].

Safety framing: Anthropic describes it as its first release since Dario Amodei's call for "pacing the frontier". It was tested externally by METR and Frontier Design, and Anthropic says it scores best of any model on its automated behavioural audit. Because it is comparable to Mythos 5.1 in biology and cybersecurity, it ships with Fable-style safeguards, with a Life Sciences Verification Program open to apply to and a Cyber Verification Program due to expand "in the coming weeks" [4].

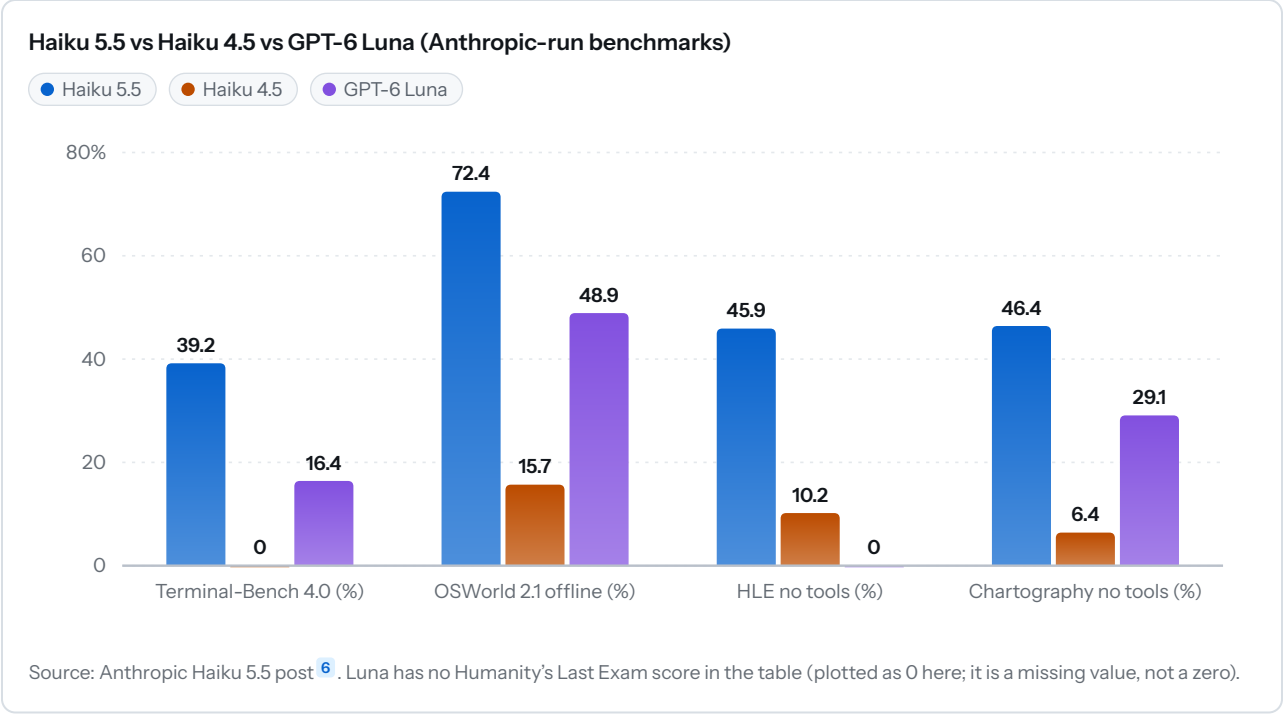
Anthropic's own table (vendor-run) shows Opus 5.5 at **66.4%** on Terminal-Bench 4.0, against 57.9% for GPT-6 Astra and 52.3% for Opus 5. On AutomationBench Astra edges it, **41.4% to 40.0%**, and on Terminal-Bench-Science Astra leads **64.6% to 58.7%** [4]. Anthropic also cautions that "benchmark margins have become a less reliable guide to real-world differences" [4]. Note that OpenAI's GPT-6.1 Sol post cites a different Astra Terminal-Bench Science figure (68.1%) than Anthropic's table (64.6%), presumably from differing configurations; neither post explains the gap.

Claude Sonnet 5.5 (28 September)

Sonnet 5.5 runs "30%+ faster" and costs "up to 30% less" per task than Sonnet 5 at an unchanged **$2 / $10** price, because it needs fewer tokens [5]. It is the first Sonnet with cyber safeguards and fallbacks, since its cyber capability is comparable to Opus 5's. It scores **70.6%** on Terminal-Bench 4.0 against 10.3% for Sonnet 5, and in the same table sits above Opus 5.5's 66.4% on that test but below it on most others (GDPval-AA 1844 vs 1846; OSWorld 2.1 80.1% vs 81.8%) [5]. Anthropic states Opus 5.5 "remains clearly stronger at complex, open-ended work requiring sustained judgment" [5].

Claude Haiku 5.5 (7 October)

Billed as “the cheapest, fastest, and most capable small model we’ve ever released”, Haiku 5.5 costs around 75% less to run than Haiku 4.5 on average, and is the first Haiku with an adjustable effort setting [6]. Anthropic also halved Sonnet 5.5’s cache-read price, making Sonnet “around 20% cheaper on most agentic work”, and added a monthly API credit for Max and Team subscribers [6].



Source: Anthropic Haiku 5.5 post [6]. Luna has no Humanity’s Last Exam score in the table (plotted as 0 here; it is a missing value, not a zero).

Simon Willison’s reading of the price is more cautious than the headline. The previous Haiku cost $1/$5 and Haiku 5.5 matches Luna’s **$0.10/$0.50 up to 100,000 tokens**, then rises fivefold to $0.50/$2.50, whereas Luna only steps to $0.20/$0.75 at 272,000 tokens. A new tokenizer also uses about **1.25 times** as many tokens for the same long prompt. His conclusion: within 100K tokens Haiku matches Luna’s price with higher reported scores; above it, “Luna looks like a much better deal” [11].

Google: Gemini 3.8 Live and Gemini 4 Argon

Gemini 3.8 Live (15 September)

Google calls Gemini 3.8 Live and 3.8 Live Extended Thinking “our most advanced live dialogue models yet”, built for voice interaction with parallel reasoning, real-time visual context and background task execution. They are usable through the Gemini API, Google Workspace and the Gemini app [9]. I did not establish token pricing from the portion of the post I read.

Gemini 4 Argon (30 September)

Google announced Argon, signed by Koray Kavukcuoglu, as its new frontier model for software engineering, enterprise knowledge work such as legal and finance, and cyber defence. It has a **1 million token limit**, and an introductory price of **$2 input and $10 output** with cached input at 95% off[3].

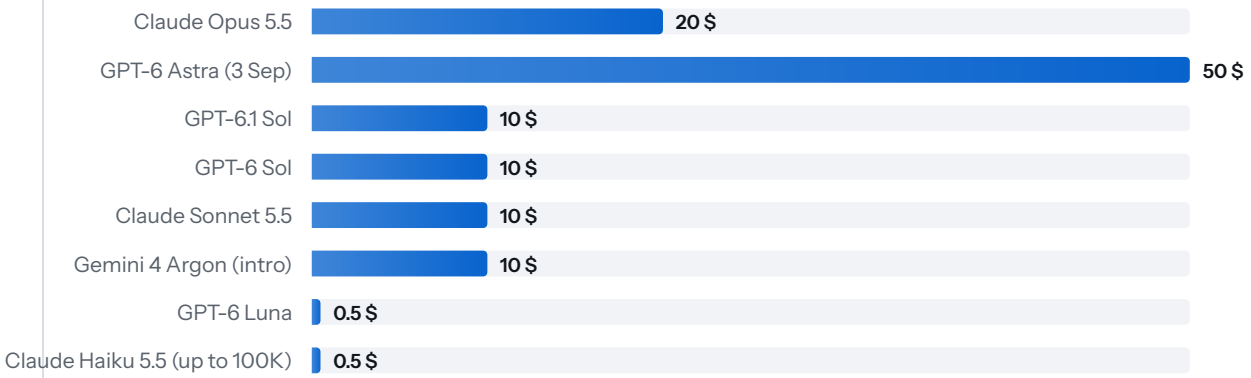
It is not generally available. Google says Argon is “rolling out to a set of trusted cyber defenders through our Fairwind Program” and that it is “actively engaged in the U.S. government’s voluntary process for pre-release model access” while it iterates on guardrails “before making Argon available to developers, enterprises, and consumers as soon as possible”[3]. No date is given. The earlier library entry, citing WorkOS, says Fairwind members get a version without cyber guardrails and must meet vetting and security conditions; I did not re-read those secondary pages for this refresh.

Google’s internal-use claims, all self-reported[3]:

- Beating a published baseline for quantum subroutine resource use by **40%** in minutes.
- Argon agents applying fleet-wide memory optimisations expected to free over **300 TiB**, with an estimated **500 TiB to 1 PiB** in total.

Pricing and benchmarks compared

Output list price per million tokens



Sources: [1] [2] [3] [4] [5] [6]. Argon is introductory pricing and not generally available; Astra launched before the window.

MODEL	LAB	DATE	INPUT ($/M)	OUTPUT ($/M)	ACCESS
GPT-6 Sol	OpenAI	22 Sep	2	10	API, ChatGPT
GPT-6 Luna	OpenAI	22 Sep	0.10	0.50	API, ChatGPT
GPT-6.1 Sol	OpenAI	29 Sep	2	10	API and paid ChatGPT plans
Claude Opus 5.5	Anthropic	22 Sep	4	20	General, safeguards on cyber and biology
Claude Sonnet 5.5	Anthropic	28 Sep	2	10	General, cyber safeguards
Claude Haiku 5.5	Anthropic	7 Oct	0.10	0.50	General, price rises above 100K tokens
Gemini 4 Argon	Google	30 Sep	2	10	Fairwind defenders only

	GPT-6.1 Sol	VS	Claude Sonnet 5.5
Date	29 Sep 2026	·	28 Sep 2026
Input / output per 1M	$2 / $10	·	$2 / $10
Cached input / cache read	$0.10	·	$0.20, halved to $0.10 on 7 Oct
Lead claim	Near-Astra at one-fifth the price	·	30%+ faster, up to 30% cheaper per task than Sonnet 5
Safeguard note	Part of GPT-6 family rated High in cyber and bio	·	First Sonnet with cyber safeguards and fallbacks

Vendor figures [2] [5] [6]. Neither post benchmarks the two against each other on a shared test.

The comparison to take away is that three mid-tier models list at the same $2 and $10, so the real differences are tokens used per task, effort settings and safeguards. Both OpenAI and Anthropic argue on cost per task rather than rate card, and each runs benchmarks that favour its own models, which is why cross-lab claims, such as OpenAI's AutomationBench lead over Opus and Anthropic's Terminal-Bench lead over Astra, should be treated as marketing until independently replicated.

Access and safety gating

The window shows frontier capability being released in tiers rather than all at once.

- **Withheld:** GPT-6.1 Astra, no release [7].
- **Limited:** Gemini 4 Argon, trusted cyber defenders first, general release undated [3].
- **Generally available with safeguards:** Opus 5.5 and Sonnet 5.5, with verification programmes for biology and cyber work [4] [5]. Anthropic says the safeguards target a narrow set of high-risk requests and that routine software development and most life sciences work are unaffected [5].

- **Open:** GPT-6 Sol and Luna, now in free ChatGPT, rated High in cyber and bio under OpenAI's framework with safeguards from the GPT-5.6 system card [10].

Context from the BBC: Anthropic plans to warn IPO investors that AI may pose "catastrophic or existential risks to humanity", per a Reuters report of a prospectus, and the same article recalls Anthropic earlier this year declining to publicly release Mythos because of its bug-finding ability [7]. Altman and Amodei have both urged the industry to slow the pace of development [7].

Caveats and open questions

- **Benchmarks are vendor-run.** Every score above comes from the releasing lab's post; some use third-party benchmark suites, but the runs are the vendors' own.
- **Differing numbers for the same model.** Astra's Terminal-Bench Science score differs between OpenAI's and Anthropic's posts [2] [4].
- **Gemini 3.8 Live pricing** was not established.
- **Argon's general-availability date** is unknown.
- **Date nuance on the Astra withdrawal:** the BBC piece is dated 29 September; the earlier entry's 28 September is unconfirmed here [7].
- **Not re-read for this refresh:** the Reuters reports, the WorkOS Fairwind summary and the third-party roundup pages cited by the earlier entry.
- **Truncated reads:** several vendor posts were long, and I read only their opening sections. Details beyond the first few thousand characters of each (for example the remainder of the Argon and Opus 5.5 posts) may add or qualify claims made here.

Bottom line

For cheap, high-volume work, Claude Haiku 5.5 and GPT-6 Luna list at the same **$0.10 / $0.50**. Haiku reports much higher scores but gets fivefold dearer above 100K tokens and tokenizes less efficiently, so Luna wins on long prompts. For mid-tier work, GPT-6.1 Sol, GPT-6 Sol and Sonnet 5.5 all list at **$2 / $10**, and the choice comes down to cost per task on your own workload. For the top tier, Opus 5.5 ($4 / $20) is the dearest generally available option in the window; Astra costs $10 / $50 and Argon is not yet open. Plan around gated access for frontier models, and verify any benchmark claim against your own tasks before migrating.

▾ **Terms used in this document (6)**

- **AutomationBench** — A Zapier-run benchmark of end-to-end business workflows across 47 tools.

- **Cache read** — A discounted price for reusing text already sent to a model, common in agent workloads where the same context is sent repeatedly.
- **Effort setting** — A control (low, medium, high, xhigh, max) trading cost and latency for deeper reasoning.
- **Fairwind Program** — Google DeepMind's limited-access programme giving vetted cyber defenders early access to Gemini 4 Argon.
- **Preparedness Framework** — OpenAI's internal framework for rating model risk in areas such as cybersecurity and biology.
- **Terminal-Bench** — A family of agentic benchmarks in which models complete tasks using a command-line terminal.
